Sequences AAF27125 represent phosphorothioate antisense oligonucleotides targetted to the human MEKKI gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human MEKKI RNA, and were analysed for their different regions of the human MEKKI RNA, and were analysed for their ceffect on MEKKI mRNA levels by quantitative real-time PCR. MEKKI (also Known as mitogen-activated protein kinase kinase limes kinase limes kinase limes kinase limes kinase limes and MAP/ERK kinase limes and mAP/ERK kinase kinase selvases. MEKKI regulates signalling events associated with appropriate signalling events associated with have been associated with the development of hyperproliferative disorders such as associated with the development of hyperproliferative disorders such as cancer. Specifically, MEKKI lies directly downstream of Bcl-2 in an comportic signalling cascade, and plays a critical role in the control of NP-kappa-B-mediated transcription at multiple points in the apoptotic cascade. The oligonucleotides of the invention are useful for diagnosis, minimation and treatment of conditions associated with MEKKI expression, which is a prevention and treatment of conditions associated with MEKKI expression, when the conditions associated with a dependent of the condition are useful for diagnosis, when the conditions associated with a dependent of the condition and conditions associated with a dependent of the condition and conditions associated with a dependent of the condition and condition a
                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound targeting nucleic acid encoding human mitogenactivated protein kinase kinase 1 (MEKK1), useful for treating diseases or conditions associated with MEKK1 expression, or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            such as inflammation, and cancer and other hyperproliferative disorders

                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Her1) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer, and psoriaeis. They are also useful as research reagents, diagnostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1
                                                                                                                                                                                                                                                                                                      Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Plant; mismatch repair; chemical inhibitor; hypermutable; PCR; primer;

The method is useful for making a hypermutable cell, in particular a plant cell, and for creating genetically altered host cells or organisms for agricultural, chemical manufacturing, pharmaceutical and environmental applications. The present sequence is a PCR primer used to sequence a chimeric beta-glucuronidase reporter enzyme coding sequence for use in
                                                                                                                                                                                                                                                                                                                                                                                            Making hypermutable cell for agricultural, pharmaceutical or environmental applications, by exposing cell to mismatch repair inhibitor such as anthracene, ATPase inhibitor, nuclease inhibitor or polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; calreticulin; antisense compound; hyperproliferative disorder; cancer; autoimmune disease; viral infection; cardiovascular disease; antisense therapy; cytostatic; immunosuppressive; virucide; antisense; phosphorothioate backbone; ss.

The invention relates to antisense compounds, compositions and methods antisense compounds, particularly antisense oligonucleotides, targetted to mucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human calls or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmume disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for diagnostics, therapeuticis, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is used to study the
                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound targeted to nucleic acid encoding calreticulin, useful for treating a human having disease or condition associated with calreticulin e.g. cancer, viral infection, autoimmune disease.

The present invention relates to a method and apparatus for transgenic and targeted mutagenesis screening of genomic DNA. The method comprises depositing genomic DNA on a substrate, adding at least one labelled probe specific for a portion of the genomic DNA, and detecting the signal from the probe. The invention also provides a system for screening DNA for a designated genetic sequence, the system includes a computer having a processor, memory, web browser and an automatic screening device that analyses samples of genomic DNA for the designated sequence. The method is useful for detecting a designated genetic sequence in a sample of genomic DNA. The method is useful for rapid identification of an organism, whose genome possesses specific genetic sequences that exist endogenously or has been modified, mutated or genetically engineered. The method is more accurate, faster and is a high volume transgenic and targeted mutagenesis screening method. The screening results are provided to a researcher more quickly than by the prior art methods. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                     Detecting designated genetic sequence in genomic DNA sample, comprises depositing genomic DNA on substrate, adding labeled probe specific for portion of DNA and detecting signal from labeled probe.

Reco protein-like 4 (RECQL4) and which hybridises and inhibits the expression of RECQL4. The compound is useful for inhibiting the expression of RECQL4. The compound is useful for inhibiting the particularly a human suspected of having or being prone to a disease or condition associated with expression of RECQL4. The compound is useful for diagnostics, therapeuties and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. This sequence represents an antisense oligonucleotide used in
                                                                                 The invention relates to a compound targeted to specific nucleobases of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphorothioate oligonucleotide calreticulin inhibitor SEQ ID NO:54.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method and apparatus for transgenic and targeted mutagenesis screening of genomic DNA. The method comprises depositing genomic DNA on a substrate, adding at least one labelled probe specific for a portion of the genomic DNA, and detecting the signal from the probe. The invention also provides a system for screening DNA for a designated genetic sequence, the system includes a computer having a processor, memory, web browser and an automatic screening DNA for a consessor, memory, we browser and an automatic screening device that analyses samples of genomic DNA for the designated sequence. The method is useful for tagid identification of an corporate of the properties or a sample of corporate of the properties of the state or genome possesses specific genetic sequences that exist endogenously or has been modified, mutated or genetically engineered. The corporate of an areacticate faster and is a high volume transgenic and targeted mutagenesis screening method. The screening results are provided to a researcher more quickly than by the prior art methods. The present consequence represents a mouse genomic DNA marker used in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                               Detecting designated genetic sequence in genomic DNA sample, comprises depositing genomic DNA on substrate, adding labeled probe specific for portion of DNA and detecting signal from labeled probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

cytostatic, cardiant, virucide, osteopathic, and antiparasitic activity, and may act as a calreticulin-inhibitor, and have a use in antisense gene therapy. The antisense compound is useful for treating a disease or condition associated with calreticulin e.g. melanoma, viral warts, rubella, schistosomiasis, congenital heart block or osteoporosis. Further, it is useful as prophylaxis, research reagent and diagnostic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound that specifically hybridizes with and inhibits the expression of human calreticulin, useful for treating diseases e.g. osteoporosis or schistosomiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleotides in length targeted to a nucleic acid molecule encoding human calreticulin, and specifically hybridises with and inhibits the expression of human calreticulin. A compound of the invention has

```

New antisense compounds targeted to nucleic acids encoding RecQ protein-like 4, useful for modulating expression of the nucleic acid and treating diseases associated with expression of the nucleic acid in humans.

The present sequence is used in the exemplification of the invention. The sequence is a phosphorothicate oligonucleotide, having 2'-MOE wings and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein kinase (MAPK). The products of the invention have antiarthritic and antiinflammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composation for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to
                                                                                                                                                                                                                                                                                                                                                                   p38 mitogen-activated protein kinase; p38 MAPK; phosphorothioate; antisense; antiarthritic; antiinflammatory; kinase inhibitor; human; inflammatory disease; rheumatoid arthritis; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel antisense compound, which is 8-30
                                                                                                                                                                                                                                                                                                                                        Human p38-beta MAPK oligonucleotide ISIS NO 17895.

The present invention describes a compound (I) that is 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a 5'UTR, 3'UTR, coding region, intron region, stop codon, intron:exon junction, exon:exon junction, or 5' mRNA variant of src-c, and which specifically hybridises with and inhibits the expression of src-c. (I) activities, and can be used in antisense therapy and in vaccines. The antisense compounds (I) can be used for modulating the expression of src-c and for treating diseases or conditions associated with expression of
                                                                                                                                                                                                                                                                                          osteopathic;

TTYH2 is useful for producing an antigen-binding molecule that is immuno-interactive with the polympeptide. The agent is useful for manufacturing a medicament for restoring a normal level and/or functional activity of TTYH2 expression in a patient, and for treating or preventing cancer or tumour. TTYH2 sequences may also be used to provide both drug targets and regulators to promote or inhibit one or more activities, and to provide diagnostic markers for cancers. The present sequence is a PCR primer used for amplifying human TTYH2 gene intron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human tweery homolog 2 polypeptides and polynucleotides, useful for producing an antigen-binding molecule that is immuno-interactive with the polypeptide or as diagnostic markers for cancers.
particularly cancer, such as breast cancer, pancreatic cancer, lung cancer, osophageal cancer, neuroblastoma cancer, osophageal cancer, neuroblastoma, retinoblastoma or Kaposi's sarcoma. (1) are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a mouse suc-c antisense chimeric phosphorothioate oligonucleotide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; tweety homologue 2; TTYH2; therapy; cancer; tumour; cytostatic; diagnostic marker; PCR; primer; ss.

The present invention relates to a method of quantifying in vivo RNA from a biological sample. This involves collecting the biological sample in a cube comprising a compound inhibiting RNA degradation and/or gene induction, forming a precipitate comprising nucleic acids, separating the precipitate from the supernatant, dissolving the precipitate using a buffer, forming a suspension, isolating nucleic acids from the suspension using an automated device, dispersing or distributing a reagent mix for reverse transcription (RY)-PCR using an automated device, dispersing or distributing the nucleic acids isolated within the dispersed reagent mix cusing an automated device and determining the in vivo levels of transcripts using the nucleic acids level in vivo levels of setecting changes in in vivo nucleic acids levels in a biological agent present, such as eukaryotic or prokaryotic cells, viruses or phages in a biological sample or for producing a medicament for treating immune collected disease, e.g., autoimmunity, rheumatoid arthritis, multiple
                                                                                                                                                                                                                                                             Nucleic acid level determination; PCR; primer; probe; DNA quantification; gene therapy; immunosuppressive; anti-HIV; antiarthritic; neuroprotective; cytostatic; antiallergic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Quantifying in vivo RNA from a biological sample for producing a medicament for treating immune related disease by determining in vivo levels of transcripts using nucleic acid/reverse transcription-PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sclerosis, cancer, immunodeficiencies such as AIDS, allergy, graft rejection or Graft versus Host Disease. The present sequence is a PCR primer/probe used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.9%; Score 15.2; DB 1; Length 20;

/note= "OTHER= Nucleotides 1-5 and 15-20 are 2'-0-methoxyethyl's (2-MOB)'s separated by a gap region of 2'-deoxynucleotides. Nucleotides 1-20 have a phosphorothioate backbone. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense compounds, compositions and methods used for modulating the expression of matrix metalloproteinase 1 (MMP1). Specifically claimed, are antisense oligonucleotides capable of modulating the expression of MMP1, and which comprise any of the 55 sequences of 20 bp, fully defined in the specification. The compound, composition and methods are useful for treating a disease or condition associated with MMP1, such as hyperproliferative disorder, e.g. cancer, inflammatory disorder or atherosclerosis, by inhibiting the expression of MMP1. They are also useful in research and diagnostics for modulating the expression of MMP1. They are also useful in research and diagnostics for modulating the expression of MMP1. The antisense compounds can act as MMP1 inhibitors and have the following activities: cytostatic. antiinflammarry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and have the following activities: cycostatic, antiinflammatory, and antiarteriosclerotic. This polynucleotide sequence represents one of the antisense compounds used for modulating the expression of matrix
                                                                                                                                                                   antisense; modulating; expression; matrix metalloproteinase 1; MMP1; hyperproliferative disorder; cancer; inflammatory disorder; atheroselerosis; MMP1 inhibitor; cytostatic; antiinflammatory; antiarteriosclerotic; ss; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding matrix metalloproteinase 1 (MMP1), useful for treating a disease/condition associated with MMP1, such as

RESULT 354 ADD19339/ ADD19339

The invention comprises the amino acid and coding sequences of feline leptin proteins. The DNA and protein sequences of the invention are useful for screening for a compound which inhibits the activity of leptin. The DNA and protein sequences of the are also useful for diagnosing and treating obseity. The present DNA sequence represents PCR primer that was used in an example of the invention.

The present invention relates to a method (MI) for breeding microorganism cells whose host character is changed by the expression of the introduced insertion sequence. The method involves introducing the insertion sequence into the genome and is transformed using DNA which has the insertion sequence. The present sequence is a PCR primer, which was used in an example from the invention. Gaps ö Ouery Match 0.9%; Score 15.2; DB 1; Length 20; Best Local Similarity 85.0%; Pred. Novel polynucleotide useful for detecting single nucleotide polymorphisms WPI; 2003-820454/77

Claim 2; SEQ ID NO 1712; 704pp; Japanese.

in human gene.

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention but the invention of the invention polymorphisms, a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo, and a microarray equipped with the SNP containing the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for detecting the single nucleotide diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents

Acyl CoA cholesterol acyltransferase-2 antisense oligo ISIS #143028.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel antisense oligonucleotides which are targeted to human acyl CoA cholesterol acyltransferase-2 (ACAT-2) nucleotide sequence (ACC42409-ACC42411), and mouse ACAT-2 (ACC42432-ACC42457). The antisense oligonucleotides specifically hybridise with and inhibit the expression of ACAT-2 nucleotide sequences (ACC42395 and ACC42402). ACAT enzymes catalyse the synthesis of cholesterol esters from tree cholesterol and fatty acyl-CoA. The antisense oligonucleotides are useful for treating an animal which has a disease or condition associated with ACAT-2, e.g. a condition involving abnormal lipid metabolism, a condition involving abnormal lipid metabolism, atherosclerosis, or
                                                                                                              /mod_base= OTHER
/note= "Oligonucleotide has phosphorothioate backbone and
all cytidine nucleotides are 5-methylcytidine. Optionally
some nucleotides with 2'-methoxyethyl (2'-MOE wings)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an antisense oligonucleotide 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding a p38 mitogen activated protein kinase (MAPK). Where the antisense compound inhibits the expression of the p38 MAPK. The antisense oligonucleotide is useful for inhibiting the expression of p38 MAPK. The antisense or condition associated with p38 MAPK, e.g. an inflammatory or an autoimmune disease (e.g. rheumatoid arthritis) or a heart disease. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a p38 MAPK antisense oligonucleotide of the invention.
                                                                                                                                                                   /note= "Phosphorothioate linkages. All cytosines are 5-
methyl cytosines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating p38 mitogen activated protein kinase (MAPK) expression, useful for diagnosing, preventing or treating diseases associated with p38 MAPK, e.g. inflammation or heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to antisense compounds targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) Kinase 6 (GRK6). The antisense compound comprises an antisense oligomucleotide that specifically hybridises with the nucleic acid and inhibits the expression of GRK6. The antisense oligomucleotide is a chimeric oligomucleotide. The antisense oligomucleotide is a chimeric oligomucleotide. The antisense oligomucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligomucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligomucleotides are useful for the treatment of diseases such as cheumatoid arthritis, drug addiction, uterine contractility, hypertension, and diseases or conditions arising from aberrant hematopoiesis. The present sequence represents an antisense oligomucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6, useful
for treating diabetes, drug addiction, uterine contractility and
/note= "This oligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-MOB) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Making hypermutable cell by exposing cell to inhibitor of mismatch repair e.g. an anthracene, an ATPase inhibitor, a nuclease inhibitor or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for making a hypermutable cell. The method comprises exposing a cell to an inhibitor of mismatch repair, where the inhibitor is an anthracene, an AFPase inhibitor, a nuclease inhibitor, or an antisense oligonucleotide that specifically hybridises to a nucleotide encoding a mismatch repair protein. The method further involves: testing the animal or plant to determine whether the gene of interest comprises a mutation. The method is useful for making a hypermutable cell. The present sequence is a PCR primer used for sequencing GUS (beta-glucoronidase) cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

New antisense oligonucleotides for modulating junctional adhesion molecule 3 expression, useful for diagnosing, preventing or treating conditions associated with the adhesion molecule, e.g. multiple sclerosis
                                                                                                                                                                                                                                                                                                                        The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding junctional adhesion molecule 3 (JAM 3). The antisense oligonucleotide is useful for inhibiting the expression of junctional adhesion molecule 3 in cells or tissues to treat diseases associated with their expression, e.g. an autoimmune disorder (e.g. multiple sclerosis), an organ rejection or an inflammation. In addition, the compound is used for diagnostics, prophylaxis, or as research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating junctional adhesion molecule 3 expression, useful for diagnosing, preventing or treating conditions associated with the adhesion molecule, e.g. multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding junctional adhesion molecule 3 (JAM 3). The antisense oligonucleotide is useful for inhibiting the expression of junctional adhesion molecule 3 in cells or tissues to treat diseases associated with their expression, e.g. an autoimmune disorder (e.g. multiple sclerosis), an organ rejection or an inflammation. In addition, the compound is used for diagnostics, prophylaxis, or as research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           reagents or kits. The present sequence represents a human junctional adhesion molecule 3 (JAM 3) antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; junctional adhesion molecule 3; JAM 3; autoimmune disorder; multiple sclerosis; organ rejection; inflammation; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.9%; Score 15.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              THE STATE OF THE S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to antisense compounds targeted to a mucleic acid encoding G protein-coupled receptor (GPCR) kinase 6 (GRK6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of GRK6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxycthyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least
                                                                                                                                                                                                                                                                                                                                                                                              New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6, useful
for treating diabetes, drug addiction, uterine contractility and
hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                haematopoiesis. The present sequence represents a human GRK6 DNA target sequence for an antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as rheumatoid arthritis, drug addiction, uterine contractility, hypertension, and diseases or conditions arising from aberrant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises an antisense oligonucleotides that are targeted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence repersents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense oligonucleotide; glucocorticoid receptor; infection; infilammation; tumour formation; diabetes; obesity; cardiovascular disorder: hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothicate backbone; 2-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises an antisense oligonucleotides that are targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human glucocorticoid receptor-specific antisense oligonucleotide #480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                       Gaps
reagents or kits. The present sequence represents a human junctional adhesion molecule 3 (JAM 3) target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 15.2; DB 1; Length 20;

This invention describes novel oiigonuclectides or polynuclectide constructs which are used in pharmaceutical or diagnostic compositions. The oligonuclectides are used for identifying modulators of pain, based on the ability of labelled oligonuclectides on also be used to diagnose disease associated with altered expression of genes of the PIM kinase family by measuring binding. The oligonuclectides have at least one modified ribose, phosphodiester and/or base component. Particularly many, of the muclectides are 'locked nucleic acids' (LNA) or at least one of the muclectides are 'locked nucleic acids' (LNA) or at least one nuclectide is a phosphorothioate. The polynuclectide construct comprises a riboxyme, DNA enzyme, vector (particularly for expression) or peptide nucleic acid, most preferably a hammerhead ribozyme or Type B-17 DNA enzyme. Than bo attached to a carrier (preferably the proteins tet, transportin or ferritin) and/or encapsulated in a liposome. The products of the invention have analgesic, uropathic, antipuritic, cytostatic, antiinflammatory and antiasthmatic activity and can be used for antisense and catalytic inhibition of PIM kinases and for antisense gene therapy. The oligonuclectides are useful for treating (1) pain, especially continence, neurogenic bladder symptoms, pruritus, tumours and catalymax incontinence, neurogenic bladder symptoms, pruritus, tumours and asthma, or generally any PIMI-kinase associated inflammation such as asthma, or generally any PIMI-kinase associated inflammation such as associated with expression of PIM family genes. ADI26552-ADI26627 incepresent antisense oligonuclectides described in the disclosure of the
                                                                                                                                                                                                                                                                                                                                                                            New oligonucleotides directed against PIM1 kinase, useful for treating, e.g. pain, urinary incontinence, tumors and inflammation, by gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotides or polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding cell division cycle 2, and inhibits the expression of cell division cycle 2. The compound, composition and methods are useful for treating a disease or condition associated with cell division cycle 2, such as hyperproliferative disrorder. e.g. cancer, or a disease or condition resulting from dysrequlation of bone metabolism, or Alzheimer's disease. They are also useful in research and diagnostics for modulating the expression of cell division cycle 2. The present sequence represents a human cell division

Example 15; SEQ ID NO 99; 61pp; English

The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding cell division cycle 2, and inhibits the expression of cell division cycle 2. The composition and methods are useful for treating a disease or condition associated with cell division cycle 2, such as hyperpoliferative disorder e.g. cancer, or a disease or condition resulting from dysregulation of bone metabolism, or Alzheimer's disease. They are also useful in research and diagnostics for modulating the expression of cell division cycle 2. The present sequence represents a human cell division cycle 2 target sequence.

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding LIM domain kinase 1. The compound Specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It precifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense cligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human LIM domain kinase 1 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.

The antisense oligonuclectide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent kinase 4 antisense oligonuclectide.
                                                                                                                                                                                                                                                                                            /note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotide, having a sequence targeted to a nucleic acid encoding cyclin-dependent kinase 4, useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer.

                             The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a human cyclin dependent
                                                                                                                                                                                                   /mod_base= OTHER
/note= "OTHER= Phosphorothioate backbone. All cytidines
are 5-methylcytidines"

                                                             New antisense compounds targeted to nucleic acid molecules encoding phospholipase D2, useful for treating diseases associated with expression of phospholipase D2, e.g. cancer, Alzheimer's disease or Parkinson's
                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense oligonucleotides which are targetted to nucleic acid molecule encoding phospholipase D2 and the encoding protein. The invention is useful for inhibiting the expression of phospholipase D2 and for treating diseases and conditions associated with expression of phospholipase D2 e.g. hyperproliferative disorder such as cancer, neurodegenerative disease such as Alzheimer's disease and Parkinson's disease. The invention is also useful for therapeutic and prophylactic applications to prevent or delay infection, inflammation and tumour formation. The present sequence is human phospholipase D2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Dobie KW;

The present invention relates to antisense oligonucleotides which are targetted to nucleic acid molecule encoding phospholipase D2 and the encoding protein. The invention is useful for inhibiting the expression of phospholipase D2 and for treating diseases and conditions associated with expression of phospholipase D2 e.g. hyperproliferative disorder such as cancer, neurodegenerative disease such as Alzheiner's disease and Parkinson's disease. The invention is also useful for therapeutic and prophylactic applications to prevent or delay infection, inflammation and tumour formation. The present sequence is human phospholipase D2 target Gaps ·. 0.9%; Score 15.2; DB 1; Length 20; 85.0%; Pred. ```
The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) corregulate chemokine-1 (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in clist or tissues comprising contacting the cells or tissues with the antisense compound and a method of treating a human having a disease or condition associated with VCC-1 comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         administering the antisense compound to a mainal to inhibit expression of VCC-1. The antisense compound to a mainal to inhibit expression of VCC-1. The antisense obligonucleotide comprises at least one modified comprises at least one modified sugar moiety, preferably a 2.0- methoxyethyl sugar moiety, and at least one modified nucleobase. specifically a 5-methylcytosine. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardion injury, cancer or an angiogenic disorder, e.g. haemangioma, tumour angiogenesis, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           atherosclerosis, psoriasis or fibrosis after myocardial infarction. VCC-1 antisense oligonucleotides may also be used for wound healing, for healing of bone fractures and cartilage damage, for regeneration of tissues or organs, for treating periodontal diseases, for gut protection or regeneration, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense
vascular endothelial growth factor; ss; antisense compound; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; antisense oligonucleotide; diabetes; immunological disorder; cardiovascular disorder; neurological disorder; ischaemia; reperfusion injury; cancer; angiogenic disorder; haemangioma; tumour angiogenesis; rheumatoid arthritis; atherosclerosis; psoriasis; fibrosis; myocardial infarction; wound healing; bone fracture;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           management of atrial fibrillation. This sequence represents an antisense oligonuclectide targeted to DNA encoding the human VCC-1 polypeptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compounds targeted to a nucleic acid molecule encoding vascular endochalial growth factor co-regulated chemokine-1 (VCC-1), useful for treating VCC-1-associated disorders, e.g. diabetes or a neurologic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) coregulated chemokine—I (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues compound and a method of treating the cells or tissues with the antisense compound and a method of treating a human carried antisense compound to an animal to inhibit expression of VCC-1. The antisense compound to an animal to inhibit expression of VCC-1. The antisense oligonucleotide comprises at least one modified comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified modified mucleobase, specifically a 5-methylcytosine. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, a neurological disorder, encouraged or shearmalon injury, cancer or an angiogenic abbrevial and a shearming a shearming or standard or shearming or shearmi atheroscierosis, psoriasis or fibrosis after myocardial infarction. VCC-1 antisense oligonucleotides may also be used for wound healing, for healing of bone fractures and cartilage damage, for regeneration of or regeneration, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide of tissues or organs, for treating periodontal diseases, for gut protection New antisense compounds targeted to a nucleic acid molecule encoding vascular endothelial growth factor co-regulated chemokine-1 (VCC-1), useful for treating VCC-1-associated disorders, e.g. diabetes or a Claim 4; SEQ ID NO 625; 336pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a method for culturing a porcine pluripotent cell, comprising culturing a porcine pluripotent cell in the presence of STOB feeder cells which express a porcine stem cell factor. The porcine stem cell factor is in membrane-bound form. The method is useful for establishing pluripotent or totipotent porcine cell lines. The present sequence represents a PCR primer used to clone porcine stem cell factor (pSCF), also known as porcine 'steel' factor.

The invention relates to a novel method for nucleic acid amplification, in which polymerase chain reaction (PCR) is carried out in the presence of the RecA recombinase protein of Thermophilus and/or of a protein with similar activity obtained by modification of its sequence. The method is useful for detection of single nucleotide polymorphisms (SNP). Addition of the RecA recombinase inhibits amplification of PCR by-products such as those caused by polymerase misreading and allows PCR from small amounts of template to be used for detection of SNP with high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nautionflammatory; neuroprotective; vasotropic; ophthalmological; neuroprotective; nautionflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; s.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (3) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have oytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, neuroprotective, neuroprotective, neuroprotective, antishing disease or computating a disease or can be used for preparing a omposition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's

```
The invention relates to a new compound 8-80 nucleobases in length (an antisense oligonucleotide) targeted to a nucleic acid molecule encoding forkhead box C2, where the compound specifically hybridises with the nucleic acid molecule encoding human forkhead box C2 appearing as appainant in the expression of forkhead box C2. Also included are inhibiting the expression of forkhead box C2 in cells or tissues, screening for a modulator of forkhead box C2, a diagnostic method for screening for a modulator of forkhead box C2, a diagnostic method for compound and treating an animal having a disease or condition associated with forkhead box C2. The compound and methods are useful in diagnosing and treating developmental disorders e.g. lympoedemas such as lympoedema distichiasis, dysgeneses of the mouse iridocorneal angle similar to those seen in human Axenfeld-Rieger anomaly and congenitation associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence is an antisense oligonucleotide targeting forkhead box
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compound targeted to a nucleic acid molecule encoding forkhead box C2, useful in diagnosing and treating developmental disorder.
                                        Human; ss; antisense; forkhead box C2; developmental disorder;
lympoedema; lympoedema-distichiasis; dysgenesis; iridocorneal angle;
Axenfeld-Rieger anomaly; congenital glaucoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 3 A; 7 C; 6 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense oligonuclectide is a chimeric oligonucleotide. The antisense preferably a phosphorothioate linkage. It also comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2.0-methoxyethyl (2'-MOE) sugar molety. The antisense oligonucleotide further comprises at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating never in mitosis, gene a (NIMA)-related kinase 6 expression, useful for diagnosing, preventing ctreating diseases associated with the kinase, e.g. hyperproliferative
                                                                                                                                                                                                                                                                                    /mod_base= OTHER /mod_base= OTHER /note= "This oligonuclectide has a phosphorothicate backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines"
                                                                                                                    Antisense therapy; human; NIMA-related kinase 6;
never in mitosis gene a-related kinase 6; hyperproliferative disorder;
cancer; cytostatic; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hyperproliferative disorders, e.g. cancer. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

Oligo-nucleotide(s) for modulating effects of cytomegalovirus infections - which can be hybridised with portion of RNA or DNA derived from IE1, IE2 or DNA genes of cytomegalovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The oligonucleotide was synthesised to be complementary to the IE2 NUC SIG 2 of human cytomegalovirus. This site is known to control mRNA stability, processing and/or translational efficiency. The synthetic oligomer can hybridise to the native DNA polymerase of cytomegalovirus and modulate the activity of CMV. The oligomer can be used prophylactically or therapeutically to reduce the severity of disease caused by CMV. It specifically inhibits replication of CMV by antisense inhibition of gene expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to antisense compounds targeted to a nucleic acid encoding human never in mitosis gene a-related kinase 6 (NIMA-related kinase 6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of NIMA-related kinase 6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified succeptive preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least compositied nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide for the treatment of diseases such as hyperproliferative disorders, e.g. cancer. The present sequence for an expense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides for modulating never in mitosis, gene a (NIMA)-related kinase 6 expression, useful for diagnosing, preventing or treating diseases associated with the kinase, e.g. hyperproliferative

                                                                                                                                                                                                                     ö
                                                       The oligonucleotide was synthesised to be complementary to the IEZ NUC SIG-2 region of human cytomegalovirus. This site is known to control mRNA stability, processing and/or translational efficiency. The synthetic oligomer can hybridise to the native DNA polymerase of cytomegalovirus and modulate the activity of CMV. The oligomer can be used prophylactically or therapeutically to reduce the severity of disease caused by CMV. It specifically inhibits replication of CMV by antisense inhibition of gene expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is a claimed antisense oligonucleotide (ON) which when tested for activity against cytomegalovirus (CMY) showed greater than 90% inhibition of virus at a concentration of 5 microm. The target of this ON is nucleotides 170120-141 of the intermediate early 2 (IE2) nuclear localisation signal 2 of the human CMY genome. Antisense ONs targeting CMV DNA or RNA coding for the IE1, IE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV
                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense; cytomegalovirus; CMV; human; therapy; prophylaxis; diagnosis; intermediate early complex; IB1; IB2; DNA polymerase gene; ss.
 - which can be hybridised with portion of RNA or DNA derived from IE1. IE2 or DNA genes of cytomegalovirus.

This target sequence covers part of the nuclear localisation signal 2 of intermediate ealry (IE) complex 2 gene. Antisense ONS targeting CMV DNA or RNA coding for the IE1, IE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothicate backbones, alkyl and halogen-substituted sugar moieties at the 2' position. (Updated on 25-MAR -2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnosis;
infection. The ONs may be modified to reduce nuclease resistance and increase their efficacy. Modifications include phosphorothioate backbones, alkyl and halogen- substituted sugar moities at the 2' position. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

RESULT 390 **AAT01703**

```
New oligomers are claimed which (A) have at least one peptide nucleic acid (PRA) subunit and (B) have a sequence hybridisable to AUG region, 5 untranslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or hybridisable to the E, E2, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary is shall be stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds callular uptakes. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets CWV IE2 nuclear localization
                                                                                                                                                                                                                                                                                                                                 /*tag= a //note= "at least one (and preferably all) of the backbone subunits are composed of amide units, so that the oligomer consists of the nucleobases attached covalently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma:virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.

New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5' untranslated region, intron/exon (I/E) junction or coding sequence of cytomegalorius gene selected from DNA polymerase. IE1 and IE2, or hybridisable to the E, E2, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded DNA (SSDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the first PNA strand binds with the first PNA strand binds with the first PNA strand could be helic or with the first PNA strand binds and are water soluble, which facilitates cellular uptake. Futher, since they contain amides of non-biological amine acids, they are biostable and resistant to enzymatic degradation by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents an antisense oligonuclectide ISIS 2922 which is targetted to the cytomegalovirus (CMV) immediate early 2 (IE2) mRNA. The IE2 protein is capable of transcriptionally activating proteins of cellular and viral origin and is thought to be one of the "master switches" of human CMV (HGNM) gene expression. Therefore disruption of the IE2 mRNA will lead to a reduction in HGNV infectivity. This oilgonucleotide may esp. be used in a human medicine to halt progression of CMV retinitis which can cause blindness in immunocompromised, e.g. HIV, patients: It has an additive effect with ganciclovir or foscarnet, and is not adversely affected by AZT or ddC
                                                                                                                         Antisense oligonucleotide; ISIS 2922; cytomegalovirus; CMV; immediate early 2 mRNA; IE2; human; HCMV; CMV retinitis; blindness; HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibitor; cytomegalovirus; human; antisense oligonucleotide; HCMV; regulatory profein; general transcriptional activator; DNA replication; orilyt-dependent viral replication; phosphorochioate linkage; CMV; IE2; 2-0-methyl linkage; alkylphosphonate linkage; replication deficient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                           Anti-sense oligo-nucleotide against the CMV immediate early 2 gene useful for treatment of cytomegalovirus infections, esp. retinitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

This sequence targets the imediate early 2 (IEZ) translational starts site. All of the targeted genes are required for orilyt-dependent viral replication. These sequences therefore inhibit HCMV DNA replication by hybridising to these genes under normal physiological conditions. Preferably, these sequences are modified to contain at least 1 internucleotide linkages selected from phosphorothioate, 2-O-methy, and alkylphosphonate linkages. As these sequences inhibit DNA replication, they can be used in compositions to treat or prevent HCMV infection in a cell. The replication deficient CMV strains that can be produced using these sequences will be useful for the study of CMV in the absence of mutant strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RNaseH; RNA cleavage; DNA cleavage; hybridisation; protein kinase C gene; gene expression modulation; ras; raf; therapy; AIDS; atherosclerosis; infection; cell growth; ss.

This sequence is an example of an oligonucleotide of the invention, and is an inhibitor of CMV replication. The invention relates to oligonucleotides (A), which specifically hybridises to RNA or DNA, comprises a linear sequence of molectide units linked by phosphodister or phosphorothicate linkages, comprising a first subsequence having 2'-0-CH2-O-CH3 sugar moieties and a second subsequence having 2'-deoxy cugar moieties. (A), which has RNaseH activity for cleaving a complementary strand, can be used to modulate the expression of ras, raf and protein kinase C genes, useful in the therapy of AIDS, atherosclerosis, bacterial or other infections, or to control aberrant cell growth in humans, animals or plants. (A) can also be used diagnostically, particularly when labelled, to detect overexpression of mRNA or expression of abnormal RNA, including imaging of tissue sections, and as a research reagent. (A) has increased binding affinity for complementary strands (attributable to the 2'-O-CH2-CH2-O-CH3 sugar moiety, which overcomes the loss of affinity caused by altered intersugar links), and increased resistance to nuclease (from the modified links and the 2'-O-CH2-CH2-O-CH3 sugar moiety)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;·

                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                    AAT49204-14 are oligonucleotides where at least 75 % of the nucleoside units are joined together by Sp or Rp phosphorothioate 3' to 5' linkages. The oligonucleotides are useful therapeutically, e.g. by eliciting Rwase H activity ras antisonse molecules to inhibit translation. Uses of the oligos include treating hepatitis, inflammatory diseases mediated by intercellular cell adhesion factor ICAM-1 and cytomegalovirus retinitis, as well as treatment of cancers mediated by protein kinase C alpha, c-raf kinase, Ha-ras or Ki-ras and treating AIDS. The sequence-specific phosphorothicate oligonucleotides have substantially chirally pure intereugar linkages which increase the thermodynamic stability of heteroduplexes with target RNA and DNA. The present sequence is used in the treatment of cytomegalovirus retinitis. (Updated on 02-UUL-2002 to

                                          The present sequence represents a chemically modified oligonucleotide with antiviral activity against human cytomegalovirus (CMV). The chemically modified oligonucleotide is targeted to the Ui36/37 gene of CWW, and is used to treat or prevent human CMV infections. Also, the chemically modified oligonucleotide can be used as a diagnostic probe to detect CMV in clinical and experimental samples. Compared with known anti-CMV antisense molecules the chemically modified oligonucleotide is more active, and more stable in vivo (allowing reduction in dose or less frequent administration). It has better bioavallability to target organs and tissues, and is less toxic (in trials, humans tolerated 2 hour infusion of 0.5 mg/kg without toxicity)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligo:nucleotide(s) for inhibiting transcription of hepatitis C virus RNA - contain diastereomerically pure phosphoro:thioate links for formation of more stable complexes with target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAT51073-T51079 represent inhibitors of the invention. This sequence can be used in the treatment of cytomegalovirus retinitis. 75-100 % of the nucleotides in these sequences are preferably joined by either Sp or Rp phosphorothicate 3' to 5' links. To create these sequences, 2'-deoxyribonucleoside-5'-0-(1-hiophosphate) (dNTPalphas) is prepared as a racemic mixture, and the pure Sp and Rp diastereomers are isolated (such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA transcription inhibitor; hepatitis C virus; HCV; inflammation; AIDS; phosphorothicate oligonucleotide; primer; nuclease; RNaseH; therapy; thermodynamic stability; cytomegalovirus infection; cancer; ss.

as by reverse-phase HPLC on ODS Hypersil). The chiral products are then used to make these sequences enzymatically in the presence of a template, primer, and muclases. Alternatively these sequences can be chemically synthesized. Oligomocleotides with Chirally pure intersugar links form heteroduplexes with target RNA or DNA of greater thermodynamic stability formpared with racemic mixtures), and elicit RNAsed activity. Chirally pure oligomocleotides also have a better resistance to nuclease digestion. As these sequences inhibit HCV RNA transcription, they can be used as therapeutic, diagnostic, and research agents. More generally, chirally pure phosphorothicate oligomocleotides can be used as therapeutic agents in the same way as racemic (or non-sulphur substituted) compounds, such as to treat ADDS, inflammation, such as to treat ADDS, inflammation, cytomegalovirus infection, and various cancers. (Updated on 25-MAR-2003 Inhibiting restenosis using oligonuclectide binding to cytomegalovirus nucleic acid - useful for, e.g. preventing cytomegalovirus replication particularly after angioplasty or atherectomy. pyrimidine bases that hybridise to corresponding bases in the target, connected by 5-7 atom cyclic backbone groups. The oligomucleotides are used to inhibit CWV replication, which is implicated in proliferation of smooth muscle cells. They are particularly administered at the site of injury but oral and parental administration are also contemplated. Typically the dose is 1-25 (preferably 2-15) micro mole, or when included in a delivery device, 30-3000 (preferably 300-1500) micro g/cm2 of surface area being treated. Compared with sugar-based oligomucleotides, the oligomucleotides of the present invention have higher affinity for target RNA and better resistance to nucleases. Also the target. Coligomucleotide duplex formed is not unwound in the cell and since the oligomucleotides are uncharged they enter cells more easily. Delivering the oligomucleotides from balloon catherers or stents provides a high contestration at the target site. AAV70312 represent
                                                                                                                                                                                                                                                                                                                                                                          .

The present invention describes a method for inhibiting restenosis, in subject infected with cycomegalovirus (CMV) who has undergone, or is undergoing, angioplasty or atherectomy. The method comprises administering an oligonucleotide that hybridises to at least part of a target sequence in a CMV gene. The oligonucleotide comprises purine and

                                                                                                                                                                                                                                                                                                                                                                                                           AAV28155-268 represent oligonucleotides which can be purified using the method of the invention. The specification describes a matrix that comprises a support and an affinity unit that specifically and reversibly binds a target oligonucleotide, and comprises a sequence of bases having the reverse complement of a hybridising portion of the target oligonucleotide. The matrix is used for affinity purification of synthetic oligonucleotides, specifically antisense agents, for treatment of hyperproliferative diseases, e.g. Alzheimer's for modulating expression of cell surface proteins, and to inhibit a eukaryotic pathogen,

the primers AAV60724-V60725 were used to PCR amplify codons 1-151 of the human cyclin-dependent kinase 2 (hcDK2). The amplified product was used to generate a fusion protein comprising part of the hcDK2 sequence linked to codons 155-302 of the yeast PHOSB gene. The fusion protein is used to screen for compounds that affect mammalian cell cycle regulatory proteins. The method comprises administering a compound to a cell line, which contains a reporter gene linked to an Upstream Activation Sequence (UAS) and a promoter, where the UAS binds a transcription control factor (TCF) which is regulated through cyclin/cyclin-dependent kinase (CDK) phosphorylation. Also included in the construct is an effector gene product to permit normal cyclin/CDK regulation of the reporter gene is then analysed in the cell line, thereby determining whether the compound affects the normal regulation. The method can be used to identify inhibitors and activators of mammalian cell cyclins, CDKs, cyclin/CDK complexes, cyclin kinase inhibitors of cyclin/CDK complexes, cyclin kinase inhibitors (CKIS), and cyclin/CDK complexes, cyclin dependent can be used for control control control control control control control cyclins, complexes, cyclin dependent control cyclin complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0;

acid (AAXI7925-XI7948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CMV) and are able to inhibit CMV replication. The sequence shown here represents the target site in the IE2 gene region and corresponds to the nuclear localisation signal 2 sequence. Optionally the oligonucleotides include at least one 2'.(2-methoxyxthoxy) sugar modification or phosphorothioate internucleotide methoxyethoxy) sugar modification or phosphorothioate internucleotide linkages. The oligonucleotides are used to inhibit CMV infections (by in vivo or in vitro contact with cells, iissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis
                                                                                                                                                                                               New antisense oligonucleotides that target cytomegalovirus nucleic acid
                                                                                                                                                                                                                     particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina
                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Thiazide sensitive cotransporter and ATP sensitive potassium channel genes - useful for developing products for the diagnosis and treatment of ion transport disorders, e.g. Gitelman's Syndrome or Bartter's Syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 respectively) are designed to amplify exon 10 of the human hTSC gene (see AAV40561) that codes for thiazide-sensitive Na-Cl cotransporter TSC (see AAV20682). Both primers are located within introns of hTSC. 27 Sets of specific primers (see AAV40565-V40618) were used for SSCP analysis of hTSC. Amplified products were analysed for molecular variants by electrophoresis, and identified variants were sequenced. Complete linkage of Gitelman's syndrome with TSC was demonstrated. Identification of the molecular basis of Gitelman's syndrome allows for the genetic diagnosis of this disorder. The invention provides products and methods useful for diagnosis and treatment of Gitelman's syndrome and other ion transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present oligonucleotide exemplifies the oligonucleotides of the invention. Oligonucleotides of the invention are nuclease resistant, and comprise covalamily building a ribose or deoxyribose sugar portion and base portion where the nucleosides are or deoxyribose sugar portion and base portion where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence. At least one of the nucleosides has a modified ribofuranosyl moiety bearing a 2'-aminoalkoxy or 2'-amidacoly/alkoxy substituent. The nuclease resistant compounds can be used for used for modulating the activity of DNA or RNA. They can be used for treating organisms having a disease characterised by the undesired treating organisms having a disease characterised by the undesired production of a protein. Diverse organisms such as bacteria, yeast, protococa, algae, plant and higher animal forms including warm-blooded animals can be treated in this manner. The compounds can be used for treating e.g. AIDS, atherosclerosis or tumours. They can also be used in diagnostic methods for detecting the presence or absence of abnormal RNA molecules, or abnormal or inappropriate expression of normal RNA molecules in organisms or cells. The present oligonucleotide exemplifies the oligonucleotides of the invention. Oligonucleotides of the invention are nuclease resistant, and comprise covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and base portion where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence. At least one of the nucleosides has a modified ribofuranosyl moiety bearing a 2'-aminoalkoxy or 2'-
                                                                                                                                                                                                                                                                              New 2'-O-modified oligo-nucleotide(s) - comprising nucleotide(s) comprising a 2'-aminoalkoxy or 2'-imidazolylalkoxy substituent, used for hybridisation to RNA or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protozoa, algae, plant and higher animal forms including warm blooded animals can be treated in this manner. The compounds can be used for treating e.g. AIDS, atherosclerosis or tumours. They can also be used in diagnostic methods for detecting the presence or absence of abnormal RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             molécules, or abnormal or inappropriate expression of normal RNA molecules in organisms or cells.                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                        linked oligomers. The method comprises deprotectings a 5'-hydroxy using a protic acid in a aromatic, alkylaromatic, haloaromatic, haloaromatic, haloaromatic, haloaromatic, haloaromatic, haloaromatic, haloaromatic, haloaromatic, haloaromatic, or aromatic ether solvent. The phosphorus-linked oligomers particularly oligomucleotides, are useful as diagnostic or research reagents, e.g. hybridization probes or amplification primers, useful in forensics, paleontology, evolutionary studies, for screening expression libraries, sequencing etc., or as therapeutic (antisense) agents for inhibiting expression of genes or activity of transcription factors. The aromatic solvents are less expensive to use than hazardous halogenated alkanes since they do not require large investments in recycling equipment to meet environmental standards for disposal. They are thus better sulted for large scale operations. Sequences AXXI1587-594 represent phosphorothioate oligomers synthesized using the new method of the invention
                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                         Use of aromatic solvents during deprotection of 5'-hydroxy groups in solid phase synthesis of oligonucleotides.
                                                                                                                                                                The invention provides improved methods for synthesis of phosphorus

                                                                                                                                                               The present invention describes a method for preparing phosphorothioate oligonucleotides by phosphitylating the 5'-hydroxyl of a nucleic acid moiety in an accenditile containing solvent mixture to form a phosphite intermediate (II) and oxidizing (II) with an acetyl disulfide in an acetonitrile containing solvent mixture to effect conversion of the intermediate to phosphorothioate (II). The present sequence represents a phosphorothioate oligonucleotide from an example of the present invention. The method can be used to sulphurise oligonucleotides of 8-50 nucleotides. The method is widely applicable throughout nucleic acid nucleotides. The method is widely applicable throughout nucleic acid chemistry. The process allows formation of phosphorothioate linkages in the oligonucleotides or derivatives, without the need for complex solvent mixtures and repeated washing or solvent changes. The process uses a simplified solvent system and produces oligonucleotides having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nuclease resistant; modified; deoxyfuranosyl moiety; therapy; infection; AIDS; atherosclerosis; tumour; CMV; antisense; DNA/RNA hybrid; ss.

The invention relates to a nuclease resistant compound that hybridises with RNA or DNA. The compound comprises covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and a base portion, where the nucleosides are joined together by internucleoside control inkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence; and where at least 1 of the nucleosides includes a modified deoxyfuranosyl moiety bearing a 2' substituent selected from cyano, fluoromethyl, thioalkoxyl, alkylsulphinyl, alkylsulphonyl, allyloxy and thencexy groups. The nuclease resistant oligonucleotides (ONS) can bind to and modulate the activity of DNA or RNA and can be used for treating organisms having a disease characterised by the undesired production of a protein. They can be used in therapeutic or prophylactic treatment in corganisms such as bacteria, yeast, protocoa, algae, plant and higher animal forms including warm-blooded animals. The ONS can also be used for treating infections, AlDS, atherosclerosis or tumours. The products can carried for detection and diagnosis. The ONS provide enhanced binding to targets. Increased binding of 2'-sugar modified sequence-specific ONS carried on securiticity compared to phosphorus-modified ONS. The present sequence represents a chimeric antisense oligo for CMV ö Nuclease resistant; modified; deoxyfuranosyl moiety; therapy; infection; AIDS; atherosclerosis; tumour; CMV; antisense; DNA/RNA hybrid; ss. /*tag= a

The invention relates to a nuclease resistant compound that hybridises with RNA or DNA. The compound comprises covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and a base portion, where the nucleosides are joined together by internucleoside continuation, where the nucleosides are joined together by internucleoside continuation of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence; and where at least 1 of the nucleosides includes a modified deoxyfuranosyl moiety bearing a 2' substituent selected from cyano, continuation of the nucleosides includes a modified alkeneoxy groups. The nuclease resistant oligonicleotides (ONS) can bind to alkeneoxy groups. The nuclease resistant oligonicleotides (ONS) can bind corganisms having a disease characterised by the undesired production of a protein. They can be used in therapeutic or prophylactic treating of cryanisms such as bacteria, prest, protozoa, algae, plant and higher canimal forms including warm-blooded animals. The ONS can also be used for detection and diagnosis. The ONS can also be used binding of 2'-ayagar modified sequence-specific ONS trargets. Increased binding of 2'-ayagar modified sequence-specific ONS provides superior potency and specificity compared to phosphorus-modified ONS. The present sequence represents a chimeric antisense oligo for CNV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Phosphorothioate oligonucleotide; benzyl (thio) phosphite residue; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                            Nuclease resistant oligonucleotide analogues - having nucleosides including modified deoxyfuranosyl moiety bearing 2'-substituent to increase binding affinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 benzyl(thio)phosphoramidite; probe production; linker; adapter;

This sequence represents a phosphorothioate oligonuclectide synthesised using the method of the invention. The method is for the preparation of oligonucleotides containing a substituted benzyl(thio)phosphite residue comprises reacting an (oligo)nucleotide with a 3' substituted benzyl(thio)phosphoramidite with an (oligo)nucleotide having a free 5'-hydroxy, with one of the reactants, optionally immobilised on a solid phase. The method is used to prepare oligonucleotides, or analogues, for use as probes, primers, linkers, adapters or gene fragments, for diagnostic or therapeutic use, or a research reagents. The specified substituted benzyl group can be eliminated without release of toxic acrylonitrile (contrast conventional 2-cyanoethoxy protecting groups)
                                                                                                                                          Oligonucleotide synthesis using substituted benzyl phosphoramidite for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cellular adhesion protein; proliferation; antisense oligonucleotide; alimentary canal; transport; gastrointestinal mucosa; cancer; Alzheimer's disease; beta-thalassemia; malaria; viral infection; HIV; inflammation; ss.

```
A pharmaceutical composition has been developed which comprises a nucleic acid and at least one penetration enhancer. The compositions are used:

(i) to treat or prevent any disease or disorder that can be treated with the nucleic acid, e.g. cancer, Alzheimer's disease, beta-thalassemia, malaria, viral infections (including human immune deficiency virus (HIV)), inflammation, in human or animal medicine, (ii) to investigate the role of a gene or gene product in non-human animals; and (iii) to modulate gene expression in cells, tissues or organs. The compositions provide bloavailability of at least 15, preferably 17-35, %. The penetration enhancer improves: (i) transport of the nucleic acid across the mucosa of the alimentary canal and into cells; and (ii) increases stability of the nucleic acid. Oral administration avoids the complications and expense of intravenous or other methods of administration. AAX18669 to AAX18901 represent antisense complications which can be used as the nucleic acid in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified antisense oligonucleotide with increased bioavailability after oral delivery - has heteroatomic backbone modification or 2'-modified sugar, useful for diagnosis and therapy, e.g. of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse; protein kinase C-alpha; PKC-alpha; antisense oligonucleotide; phosphorthioate; enhanced bicavailability; oral delivery; diagnosis; heteroatomic backbone modification; 2' modified sugar; tumour; autoimmune disease; inflammation; graft vs. host disease; ss.

bloavailability than the corresponding phosphorothicate oligodeoxynucleotide. Also described are compositions containing the oligomucleotides having at least one 2'-alkoxyalkoxy sugar modification and at least one 5-methylcytidine (SMeC) residue. The oligomucleotides are antisense oligomucleotides for modulating expression of target genes for diagnostic or therapeutic purposes, e.g. in cases of tumours, autoimmune disease and inflammation, including graft vs. host disease. The specified modifications increase bloavailability from the digestive tract, eliminating the need for intravenous or other routes of administration. The present sequence represents an antisense oligomucleotide which is used in example to examine the effect of 2' modifications on bloavailability after gastrointestinal administration in
The present invention describes oligomucleotides having: (a) at least one heteroatomic backbone modification or at least one 2'-sugar modification; and (b) during or after administration to the alimentary canal, greater

The oligonucleotide is a gapped 2' modified oligonucleotide, whereby one part has at least two consecutive 2'-F (2'-H) nucleotides and the second part has at least tive consecutive nucleotides with 2'-H sugar moieties. The modified oligonucleotide has increased nuclease resistance, and increased binding affinity for substrates. The oligonucleotide
         replication. The oligomucleotide is a gapped 2' modified oligomucleotide, whereby one part has at least two consecutive 2'-F (2'-H) nucleotides and the second part has at least five consecutive nucleotides with 2'-H sugar moieties. The modified oligomucleotide has increased nuclease resistance, and increased binding affinity for substrates. The oligomucleotide elicite RNss H strand cleavage of specific RNss. Oligomucleotide invention are useful for the diagnosis, detection and treatment of conditions susceptible to oligomucleotide therapeutics (e.g. AIDS and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense oligonucleotide; CMV replication; nuclease resistance;

This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique trarget of larvest complement of part of a unique trarget oligonucleotide present in a mixture of target deletion sequence oligonucleotides. The compositions form a method for characterizing a sample of target deletion oligonucleotides which are labelled and hybridize with the probe oligonucleotides of the ensor arrays. Such oligonucleotides and their targets are represented in AAX23548.X23709. Compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human retrovirus, including influenza virus. Epstein-Barr virus, Respiratory Syncytial Virus or cytomegalovirus (CWV). The compositions enable characterization of deletion sequence oligonucleotides having related,
elicits RNase H strand cleavage of specific RNAs. Oligonucleotides of the invention are useful for the diagnosis, detection and treatment of conditions susceptible to oligonucleotide therapeutics (e.g. AIDS and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Also, if the specificity of the oligonucleotide's nucleobase sequence for its reverse complement is not modified, the method may be performed using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compositions comprising sensor arrays made up of unique probe oligonucleotides - useful for characterizing a sample of target deletion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              but different nucleobase sequences, and quantification of different species of deletion sequence ("target") oligonucleotides in a mixture.
                                         atherosclerosis). (Updated on 20-MAR-2003 to correct PR field.)

which is the reverse each array comprises a unique probe oligonuclectic, which is the reverse complement of part of a unique probe oligonuclectide, which is the reverse complement of part of a unique target oligonuclectides. The compositions form a method for characterizing a sample of target deletion oligonuclectides which are labelled and hybridize with the probe oligonuclectides which are labelled and oligonuclectides are represented in AAX23548.X23709. Oligonuclectides and their targets are represented in AAX23548.X23709. Compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human immunodeficiency virus (HIV), or a non-human cerrovirus, including influenza virus, Epstein-Barr virus, Respiratory Syncytial Virus or cytomegalovirus (CWV). The compositions enable characterization of deletion sequence oligonucleotides having related, but different nucleobase sequences, and quantification of different species of deletion sequence ("target") oligonucleotides in a mixture. Also, if the specificity of the oligonucleotide's nucleobase sequence for the oligonucleotide's nucleobase sequence.
                                                                                             0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reverse complement is not modified, the method may be performed using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compositions comprising sensor arrays made up of unique probe oligonuclectides - useful for characterizing a sample of target deletion oligonuclectides.
                                                                                                                                                                                                                                                                                                                                                                                                                             Deletion sequence oligonucleotide; sensor array; eukaryotic pathogen; probe; cellular adhesion modulator; cellular proliferation modulator; human retrovirus; human immunodeficiency virus; non-human retrovirus;

Containing a Human immunodeficiency virus (HIV) homology region and a callular regulatory factor. Defibriotide is a polyamino salt of a callular regulatory factor. Defibriotide is a polyamino salt of a deoxyribonucleic acid obtained from mammalian tissue. The products can be careful, protozoan infection, schistosoma infection e.g. Schistosoma infection infection, schistosoma infection e.g. Candida tropicalis and japonicum. Schistocarca Leishmania infection, Trypanasoma infection e.g. Candida tropicalis and candida Albicans, Aspergillus infection, pneumocystis carinii infection, candida Albicans, Aspergillus infection, bneman papilloma cytromegalovirus infection, departicles virus infection, genetic diseases e.g. Duchenne's muscular dystrophy and Down's syndrome; degeneratic diseases e.g. buchenne's macular dystrophy and convins infection damage; neorgases, neuropathy, cardiomyopathy, admentia, altaheimer's Syndrome, retinitis pigmentosa, ataxia, selzures, proximal muscle weakness, Leber's factoration, panceratic cancer, neuroblastoma, cleukemia, bladder carcinoma, breast cancer, skin cancer, ung cancer, and colon cancer; and skin diseases, e.g. molluscum contagiosum, bacillary colon cancer; and skin diseases, e.g. molluscum contagiosum, bacillary colon cancers, and skin diseases, e.g. molluscum contagiosum, bacillary colon cancers, and skin diseases, e.g. molluscum contagiosum, bacillary colon cancers, and skin diseases, e.g. molluscum contagiosum, bacillary addition a drug resistance can be treated via administering the nucleic cating components of defibrotical dermatitis, Bosinophilic folliculitis. In addition a drug resistance can be treated via administering the nucleic cating components of defibrotical dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of defibrotide nucleic acid components - for treating e.g. infectious diseases, genetic diseases, degenerative diseases, DNA damage, neoplasia and skin disease, particularly HIV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present oligomucleotide is given in a specification disclosing a new lipid compound and its salts, solvates and hydrates. The compound comprises a hydrophobic tail part covalently linked to a hydrophilic head part. A region proximal to the hydrophobic tail part has a net positive charge at physiological pH and a region distal to the hydrophobic tail part has a net negative charge at physiological pH. A disulphide bond connects the regions. The lipid compound is useful for the construction of liposomes used as vehicles for delivering pharmaceutical agents into cells. The lipids and liposomes are fusogenic with membranes and deliver pharmaceutical agents to tissues or cells without inherent aggregation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New pro-cationic lipid compounds useful as components of liposomes used as vehicles for delivering pharmaceutical agents into cells.

Reporter probes AAC61629-32 were used to detect human lymphotoxin gene alleles. The method of the invention was used for detecting single nucleotide polymorphisms (SNPs) in the lymphotoxin gene. The method utilises electronic circuitry on silicon microchips. The method provides accurate discrimination of amplified DNA samples following electronic transport, concentration, and attachment of DNA to selectrodes (test sites). The test sites make up organised arrays of samples that are comprising wild type and mismatched sequences to validate the SNP genotype. Multiples of SNPs in target nucleic acids from a patient sample sources can also be detected using the electronically addressable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense inhibitor; oligonucleotide delivery agent; erythema multiforme; expression modulator; cellular adhesion protein; malignant melanoma; cellular proliferation modification; toxic epidermal necrolysis; psoriasis; lichen planus; carcinoma; Paget's disease; Kaposi's sarcoma; pulmonary fibrosis; Lyme disease; infection; therapy; HCMV; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         °,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present oligonucleotide is given in a specification disclosing a new lipid compound and its salts, solvates and hydrates. The compound comprises a hydrophobic tail part covalently linked to a hydrophilic head part. A region proximal to the hydrophobic tail part has a net positive charge at physiological pH and a region distal to the hydrophobic tail part has a net negative charge at physiological pH. A disulphide bond connects the regions. The lipid compound is useful for the construction of liposomes used as vehicles for delivering pharmaceutical agents into cells. The lipids and liposomes are fusogenic with membranes and deliver pharmaceutical agents to tissues or cells without inherent aggregation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New pro-cationic lipid compounds useful as components of liposomes used as vehicles for delivering pharmaceutical agents into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mismatch reporter probe used to detct human lymphotoxin gene alleles.

This sequence represents an antieense inhibitor of HCWV. The invention relates to a pharmaceutical composition comprises an oligonucleotide (ON) admixed with a topical delivery agent. The compositions can be used for the delivery of a ribozyme, an external guide sequence, an antisense ON, an antisense peptide nucleic acid, an aptamer or a molecular decoy. The ONS can be used to modulate expression of a cellular adhesion protein or modulate a rate of cellular proliferation. The compositions can also be used to treat psoriasis. They can also be used to treat psoriasis. They can also be used to treat because cell carcinoma, malignant melanoma, paget's disease, carcinoma, squamous cell carcinoma, malignant melanoma, paget's disease, carcinoma, squamous cell carcinoma, malignant melanoma, paget's disease, carcinoma squamous cell carcinoma, malignant melanoma, paget's disease, carcinoma including chickens and turkeys, domestic household, sport or farm animals including rats, mice, rabbits and guinea pigs, cish, reptiles and zoo animals. The compositions and methods may also be used to examine the function of various proteins and genes in vitro in cultured or preserved dermal tissues and in animals

Formulating hair treatment composition useful for producing hair preparations for improved hair characteristics by using human keratin allelic variants, which has not been cross-linked.

Example 3; Page 43; 55pp; English.

present invention describes a method for formulating a hair treatment composition by using non-naturally occurring human keratin protein which has not been previously cross-linked. The method is useful for producing hair treatment composition for improved hair characteristics, and hair treatment preparations tailored to an individual's preference. The keratin is added to hair cleansing compositions, e.g. pre-shampoo, The

shampoo, or conditioning rinse, to hair styling or shaping compositions, e.g. gel, spray or mousse, or in hair dyeing, bleaching or tinting compositions. It may also be used in developing nail care products, such as nail polish and nail polish remover. The method provides hair treatment preparations tailored to the individual's preferences as well as to the manufacturers' preferences of hair treatment compositions. The present sequence represents a PCR primer for the murine type II hair feratin clone pmKII-63'-noncoding region, which is used in an example from the present invention 9999999999988

Composition for pulmonary delivery useful for treating and diagnosing pulmonary diseases such as asthma, tuberculosis, etc. pulmonary diseases such as asthma,

Claim 54; Page 33; 85pp; English.

This sequence represents an antisense inhibitor of HCMV. The invention relates to a pharmaceutical composition (C) for pulmonary delivery of an oligonucleotide, comprising at least one oligonucleotide or its bioequivalent. (C) can be used to investigate the role a of gene or gene product in an animal other than human. (C) is also useful in a method of modulating the expression of a gene in an animal. (C) is useful in treating or diagnosing asthma, lung cancer, pulmonary fibrosis, rhinovirus, tuberculosis, bronchitis, pneumonia. The oligonucleotides are useful in determining the nature, function and potential relationship to body or disease status in animal of various genetic components of the body. (C) is useful for therapeutic, palliative or prophylactic treatment or to prevent the onset or recurrence of the diseases associated with pulmonary disorders. (C) is also useful in the treatment of diseases caused by viruses (such as respiratory syncytial virus, Hemophilus

```
influenza, parainfluenza, etc.), obstructive lung disorders (such as pulmonary embolism or anaphylaxis), chronic obstructive pulmonary disease (COPD), emphysema, chronic bronchitis, bronchiectasis and cystic fibrosis. (C) administered through pulmonary delivery overcomes the complication and expenses associated with other routes of administration. Modified or substituted oligonucleotides have enhanced cellular uptake, target binding and increased stability in the presence of nucleases. Pulmonary administration of phosphodiester oligonucleotides lowers the level of nuclease activity in lung tissue to afford phosphodiester oligonucleotides longer lifetimes in lung tissue

pharmaceutical composition useful for pulmonary delivery of gonucleotide for treating asthma, lung cancer and pulmonary fibrosis. oligonucleotide for treating asthma, lung Claim 62; Page 34; 90pp; English.

pulmonary delivery of an oligonucleotide comprising at least one coligonuclectide where the sugar moiety of at least one nucleoside unit of the oligonucleotide is not a 2'-deoxyribofuranosyl sugar moiety or at least one internucleotide linkage within the oligonucleotide is not a phosphodiester or a phosphotioate linkage. The composition is useful for treating an animal having or suspected of having a disease or a disorder The present invention describes a pharmaceutical composition for

```
·,
                                                                          influenzae, parainfluenza, obstructive lung disorders e.g. pulmonary embolism or anaphylaxis, chronic obstructive pulmonary disease (COPD), emphysema, chronic bronchietis, bronchiectesis and cystic fibrosis. The oligomuclectides are also useful for determining the nature, function and potential relationship to body or disease states in animals or various genetic components of the body. Pulmonary administration of an antisense oligomuclectide bypasses the complications and expense associated with intravenous and other routes of administration providing enhanced delivery of the oligomuclectides. The modified oligomuclectides have enhanced callular uptake, enhanced binding to target and increased stability in the presence of mucleases. The present sequence represents an antisense oligomuclectide used in the exemplification of the present
that is treatable with one or more nucleic acids e.g. asthma, a cancer the lung, pulmonary fibrosis, rhinovirus, tuberculosis, bronchitis or pneumonia and other lung disorders e.g. respiratory synctial virus, H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

New liposome compositions having long plasma half-lives, used for delivering compounds for treating e.g. tumors, inflammation or autoimmune diseases.

Disclosure, Page 33; 91pp; English.

The present invention describes a liposome (I) which has a plasma half-life of at least 5 hours and comprises at most 10 mol \$ of a

```
prospiratory The liposomes can be used to encapsulate a bioactive agent, e.g. an anticancer agent, an anti-inflammatory agent, an anticancer agent, an anti-inflammatory agent, an anticancer agent, an anti-inflammatory agent, an antisense compound (such as a hemimer, molecular decoy or an aptamer) or an antisense compound (such as a ribozyme, an external guide sequence, a compound comprising at most synthetic molety which has nuclease activity, an attisense peptide nucleic acid, an attisense nucleotide and/or comprising a sequence that hybridises to a nucleotide and/or a viral gene or a gene encoding a cellular adhesion molecule). Such liposomes can be used for: (1) preventing cancer or reducing the everity of inflammation in a mammal; (2) preventing or reducing the severity of inflammation in a mammal; (2) preventing, or organisms expression of a gene by contacting cells, tissues, organs or organisms expression of a gene by contacting cells, tissues, organs, reducing the arte of progression of or reducing the severity of symptoms resulting from an autoimmune disease in a mammal. The liposomes have long circulating half-life in mammalian plasma, AAZ48119 to AAZ48130 represent

oligonuclectides designed to have therapeutic activity against certain non-retroviral viruses. The invention relates to new compositions for the non-parenteral delivery of oligonuclectides comprising at least one oligonuclectide in an emulsion. Oligonuclectides delivered via the compositions of the invention can be used to modulate expression of a cellular adhesion protein, modulate a rate of cellular proliferation, or have biological activity against eukaryotic pathogens or retroviruses. They can be used for treating conditions including e.g., ulcerative colitis, Crohn's disease, inflammatory bowel disease or undue cellular. proliferation. The compositions can enhance the local and systemic uptake and delivery of nucleic acids via non-parenteral routes of administration New oligonucleotide compositions used for the non-parenteral delivery of e.g. antisense oligos, ribozymes, peptide nucleic acids, molecular decoys, external guide sequences or aptamers. The present invention describes nuclease resistant oligonucleotides (I) comprising 2'-fluoro modified ribofuranosyl nucleotides. (I) comprise covalently bound nucleotides, where the nucleotides are joined together by: (a) internucleotide linkages such that the base portion of the nucleotides forms a mixed base sequence; and (b) at least one of the nucleotides forms a modified ribofuranosyl group bearing a 2'-fluoro substituent; provided that at least two of the nucleotides are 2'-fluoro modified ribofuranosyl nucleotides when the internucleotide linkages are phosphodiester nucleotides. (I) bind to their target mRNA and inhibit its phosphodiester nucleotides. (I) bind to their target mRNA and inhibit its appropriate strength and fidelity to its target RNA/DNA. (I) are also useful as research agents, diagnostic agents and as oligonucleotide therapeutics. (I) may be used to treat atheroscalerosis following angioplasty to prevent reocclusion of the treated arteries. (I) have been used in conjunction with AZT to treat AIDS patients. (I) have been used to modulate the expression of RAF gene, a callular gene whose activate form has been implicated in abnormal cell proliferation and thouse the expression of the treated arteries. (I) may also be the conjunction with hard to the properties of higher quality than a chocker whose conjunction with a properties of higher quality than a chocker whose conjunction with a properties of higher quality than a chocker whose conjunction with a properties of higher quality than a chocker whose conjunction with a conjunction properties of higher quality than a chocker whose conjunction with a conjunction properties of higher quality than a conjunction with a conjuncti

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nuclease resistant oligonucleotides (I) comprising 2-fluoro modified ribofuranosyl nucleotides. (I) comprise covalently bound nucleotides, where the nucleotides are joined together by: (a) internucleotide linkages such that the base portion of the nucleotides forms a mixed base sequence; and (b) at least one of the nucleotides includes a modified ribofuranosyl group bearing a 2-fluoro substituent; provided that at least two of the nucleotides are 2-fluoro modified ribofuranosyl nucleotides when the internucleotide linkages are phosphodiester nucleotides. (I) bind to their target mRNA and inhibit its expression. (I) are resistant to nuclease degradation and hybridise with appropriate strength and fidelity to its target RNA/DNA. (I) are also useful as research agents, diagnostic agents and as oligonucleotide therapeutics. (I) may be used to treat atherosclerosis following angioblasty to prevent reocclusion of the treated arteries. (I) may also be used in conjunction with AZT to treat AIDS patients. (I) have been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      used to modulate the expression of RAF gene, a cellular gene whose activate form has been implicated in abnormal cell proliferation and tumour formation. (I) are also used to modulate the expression of protein kinase C. (I) exhibit hybridisation properties of higher quality than phosphorous modified oligonuclectide duplaxes containing methylphosphonates, phosphoramidates and phosphate triesters. The present sequence represent an oligonucleotide used in the exemplification of the
                                                                                                                                                                                                                Nuclease resistant oligonucleotides useful as research agents, diagnostic agents, and in the treatment of atherosclerosis and AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to the use of acetonitrile having a water content of 30-1250 ppm in the linking of a phosphoramidite nucleoside to a solid support-bound nucleoside, and to the use of this process in the synthesis of oligonucleotides. The method is used for the coupling of a phosphoramidite nucleoside to a solid support-bound nucleoside, particularly in the large-scale synthesis of oligonucleotides using the phosphoramidite method. The oligonucleotides can be used in diagnostic, research and therapeutic applications, e.g., as probes, primers, linkers, adapters and antisense oligonucleotides. The use of acetonitrile having a water content of 30-1250 ppm as compared to conventional methods using lower water content acetonitrile (at most 30 ppm) provides more economical synthesis without reduced efficiency of oligonucleotide synthesis. Sequences AAA14474 represent oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Phosphorothicate, activator, oligonuclectide synthesis; phosphoramidite, phosphitylating reagent; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention describes nucleoside phosphoramidites and oligomucleotides (OW's) prepared using pyridinium, imidazolium or benzimidazolium salts as activators. The preparation of a phosphitylated compound comprises reacting a compound having a hydroxyl group with a phosphitylating reagent in the presence of a pyridinium salt in a solvent. The phosphoramidites are useful as building blocks for synthesis of oligomucleotides, which are potentially useful in therapeutic and lagnostic applications. The activators can be produced in situ by mixing pyridine and an acid, producing benefits in large scale synthesis. Compared with conventional activators, e.g. 1H tetrazole, the pyridinium captus, and materials necessary for their generation in situ, are nonexplosive and easier to store, and also cheaper and have higher solubility in organic solvents. Final purity of the phosphitylated pyridinium salts are used. The present sequence represents a phosphorothioate 21-mer oligomucleotide, the synthesis of which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide; non-parenteral; multi-particulate; phosphorothioate; ss.

                                                                                                                                                      The present invention relates to non-parenteral multi-particulate formulations for transporting agents (for example therapeutic) across mucosal membranes. The formulations comprise carrier particles bound with a biologically active agent and a penetration enhancer. The formulations associate with buccal, nasal, pulmonary, gastrointestinal and vaginal mucosal membranes to transport the biologically active agents to the lymph system, blood system or epithelial tissue of the subject. The formulation is administered orally which is preferred by patients. The present sequence is an example oligonucleotide that may be used in the
